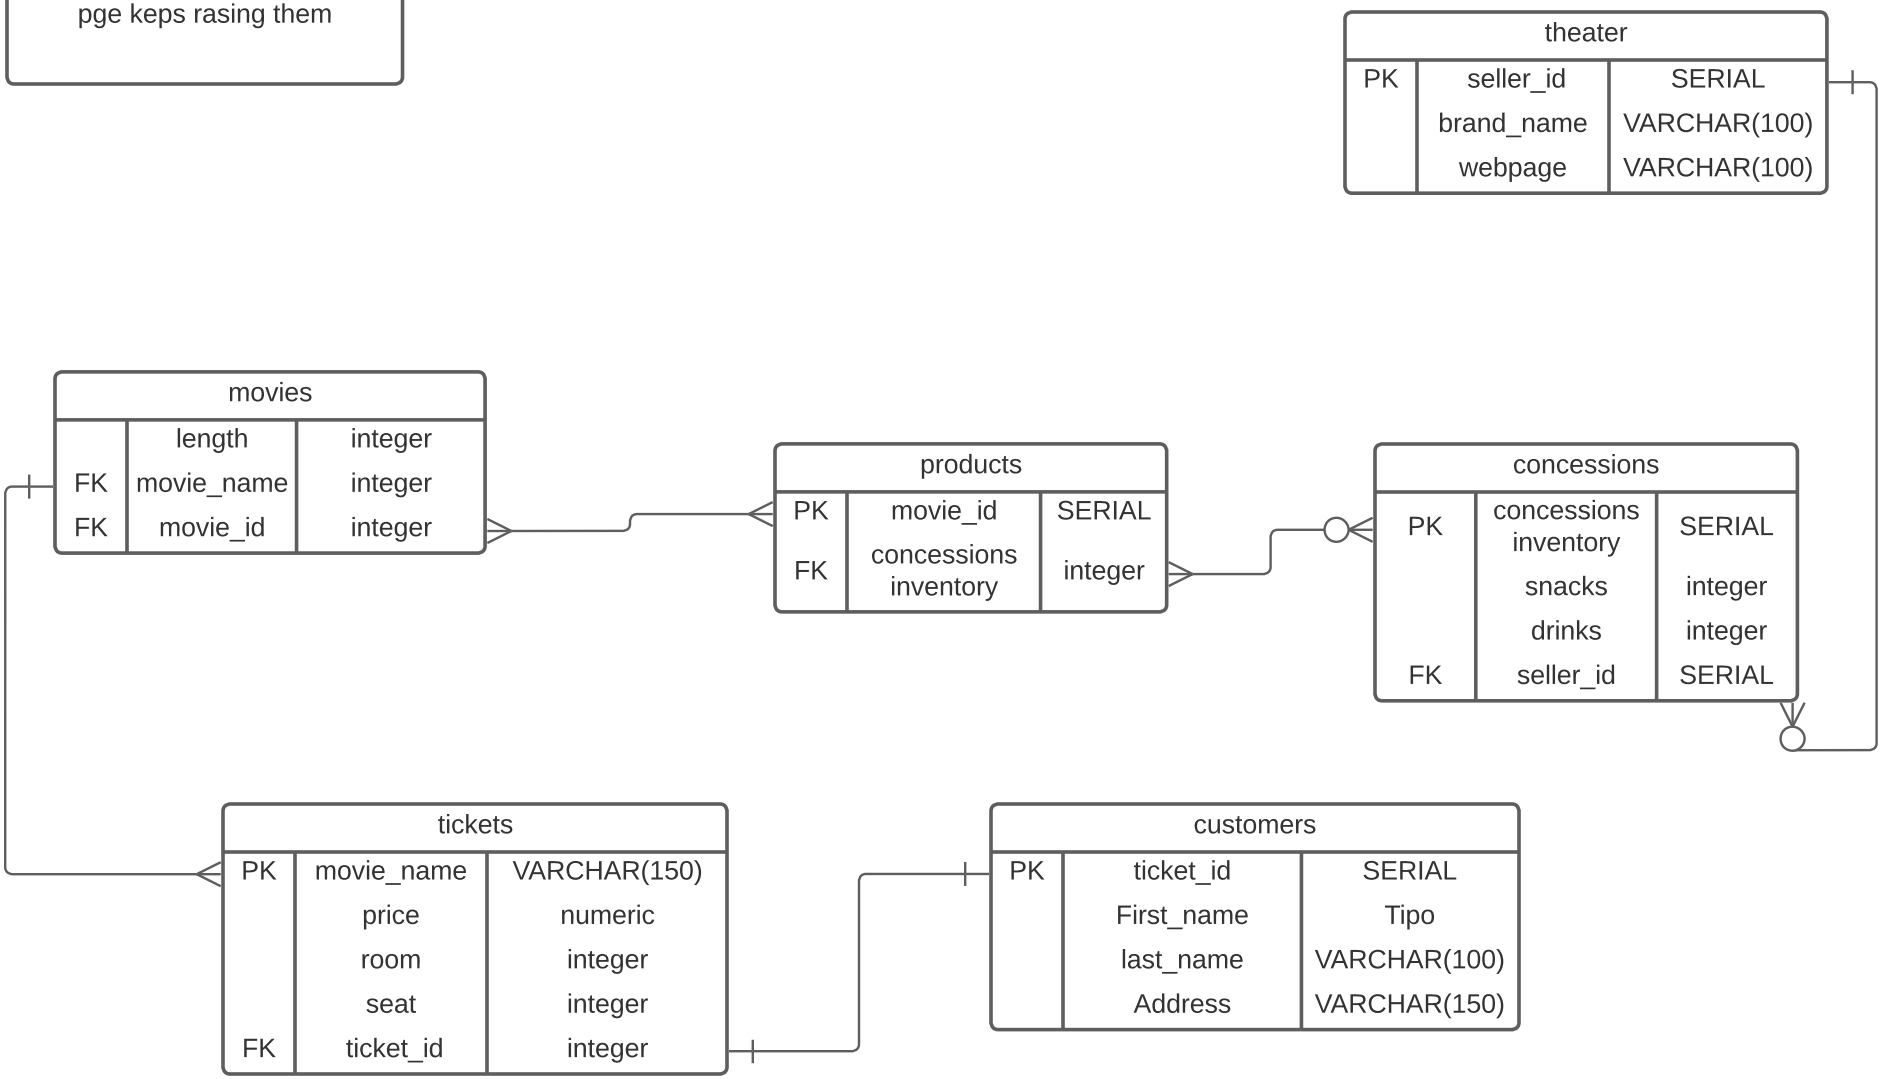
Sorry for all the misspeling, it's hard to edit i lteFsman FKbut he pge keps rasing them



first I start on theater by using a one to zero or many relationship because one theater is selling many concessions
then I used a zero or many to a many relation because concenssions can store one or many products (By the way, concessions inventor = concessions inventory)
My reasoning on movie_id is that there can be many movies_ids for many different movies
And from movies every movie has different names or many names
and from customer there can only be one ticket id to every ticket sold.
